# Finance Tracker

# Implementation Summary

Summary of completed UI, dashboard, charts, forms, navigation, and feedback improvements - 31 October 2026

## Overview

The Finance Tracker interface was redesigned and refined across the main user journeys while preserving the existing Express, EJS, PostgreSQL, and Chart.js architecture. The work focused on clearer financial information, professional responsive layouts, reliable user feedback, and improved usability on desktop and mobile devices.

## Events page

- Polished event cards, calendar layout, summary sections, empty states, hover states, and responsive behavior.
- Connected event summaries and calendar indicators to real event data.
- Added functional date navigation and improved event form presentation.

## Saving page

- Replaced hardcoded totals with calculated saved amount, target amount, progress, completed goals, and goal counts.
- Improved goal cards, progress indicators, completed-goal activity, empty states, and responsive spacing.
- Corrected goal deletion behavior and maintained PostgreSQL lowercase column compatibility.

## Transactions page

- Removed sample/fake transactions and hardcoded fallback totals.
- Fixed the transaction route so it consistently renders the transaction page.
- Added accurate income, expense, transaction-count, and balance summaries.
- Improved filters, table styling, actions, hover states, mobile layout, and empty-state messaging.

## Navigation and flash messages

- Kept the shared navbar search visible by default and added page-level hiding for Quiz.
- Fixed missing redirected messages such as login success by exposing shared success, error, and info flash locals.
- Added dismiss buttons, automatic dismissal, accessible alert roles, and responsive placement below the mobile navbar.
- Prevented form flash messages from overlapping headings by returning them to normal document flow inside form cards.

## Dashboard and financial status

- Added real dashboard metrics based on transaction data with profile-income fallback:
- Total Income, Remaining Balance, Total Spent, This Month's Expenses, and Savings Rate.
- Negative balances and negative savings rates remain visible when spending exceeds income.
- Added responsive metric-card layouts for desktop, tablet, and mobile screens.

## Dashboard charts

- Added and refined expense breakdown, monthly expense trend, and payment-method charts.
- Changed the third chart to a bar chart for clearer payment-method comparison.
- Moved the payment-method chart into the first row and kept Monthly Expenses full-width in the second row.
- Fixed chart labels, legends, canvas sizing, whitespace, card heights, responsive grid behavior, and Chart.js 2.9.4 compatibility.

## Forms

- Polished Login, Register, Add Event, Add Saving, Add Transaction, Change Password, and Verify Email forms using consistent input, button, focus, spacing, and responsive patterns.
- Improved verification feedback and removed duplicate success-message display after OTP requests.
- Added clearer validation and accessible interaction states without changing route behavior.

## Quiz page

- Restructured the page body/sidebar/navbar order for consistent layout behavior.
- Added a professional start screen, question status bar, answer states, progress bar, result screen, metadata, and mobile layout.
- Kept the navbar search hidden only on Quiz, as requested.

## Files touched

| Area | Primary files |
| --- | --- |
| Server and routes | app.js |
| Dashboard and page templates | views/Dashboard.ejs, views/event.ejs, views/saving.ejs, views/transactions.ejs, views/quiz.ejs |
| Shared navigation and feedback | views/partials/top-navbar.ejs, views/partials/flash.ejs, public/js/flash.js |
| Client behavior | public/js/index.js |
| Styling | public/css/styles.css, public/css/hello.css, public/css/login.css, public/css/quiz.css |

## Validation completed

- Node syntax checks passed for app.js and public/js/index.js.
- EJS compilation checks passed for Dashboard, Quiz, navbar, flash, and form templates.
- git diff --check passed for formatting and whitespace validation.
